Hiring Team

Moniepoint

Re: Full-Stack Engineer (Remote)

Dear Hiring Team,

I'm writing to apply for the Full-Stack Engineer role at Moniepoint. I've followed the growth of Africa's merchant payment infrastructure with real interest, and building scalable services that power financial access for millions of businesses is exactly the kind of high-impact engineering work I want to be doing. My background combines three years as a Systems Engineer at Tata Consultancy Services, hands-on freelance ownership of a full client project, and a full-stack skill set across the JavaScript/TypeScript and Java ecosystem that lines up closely with what you're looking for.

At TCS, I've worked across the stack that matters most for this role. I built a Java Selenium-based automation bot that ingests shift rosters and distributes incoming support tickets in round-robin fashion, which pushed our SLA compliance to 99%. I also developed a suite of shell scripts that automated middleware handovers and server health checks, saving the build team over 5 hours of manual effort every cycle. Both projects required the same things this role demands: designing a solution from a rough specification, integrating it cleanly with existing systems, and iterating based on real operational feedback.

That drive to own a project end-to-end goes back to my final year of college, when I worked as a freelance PHP Web Developer for a niche marketplace client based in Australia, sourced through Freelancer.com. I independently designed and built a responsive web application handling customer-provider workflows, job postings, a quotation system, and membership access, managing the client relationship and the full delivery timeline myself. Around the same period, I interned at Zoho, building a multithreaded Java desktop file-transfer application over TCP/IP sockets. Since joining TCS, I've built on that foundation with personal projects like Debate Cast (React, FastAPI, Perplexity Sonar API) and Calm Circle (Node.js, Express, and MongoDB), giving me practical range across React.js, Node.js, Express.js, TypeScript, PostgreSQL, and MongoDB, alongside the OOP grounding in Java this role asks for. I'm comfortable working across the stack, from designing an algorithm to debugging it in production, and I actively look for opportunities to pick up new tools quickly, as I did moving from PHP and Angular to a modern React/Node/TypeScript stack.

I recognize my experience is a closer match to the technical scope of this role than to the exact years listed, and I want to be upfront about that. What I can offer instead is a track record of taking real ownership of production systems and client projects, learning fast under pressure, and delivering measurable results, 99% SLA compliance and 5+ hours saved per cycle, being two concrete examples. I'd welcome the chance to bring that same ownership to Moniepoint's engineering team.

Thank you for considering my application. I'd be glad to walk through any of these projects in more detail and discuss how I can contribute to your team.

Sincerely,

Bala Yokesh Mani A
